There are five design issues associated with MTJ-based LUT circuits. The first design issue corresponds to the large area overhead of the sense amplifier due to a small difference in MTJ resistance. To overcome this issue, a nonvolatile logic-in-memory (N-VLIM) structure has been proposed to reduce the overhead [18,19,24]. The second design issue is the stochastic nature of MTJ switching.

Non-volatile memory or non-volatile storage is a type of computer memory that can retrieve stored information even after having been power cycled. In contrast, volatile memory needs constant power in order to retain data. Examples of non-volatile memory include flash memory, read-only memory, ferroelectric RAM, most types of magnetic computer storage devices, optical discs, and early computer storage methods such as paper tape and punched cards. Non-volatile memory typically refers to storage in

Nonvolatile BIOS memory refers to a small memory on PC motherboards that is used to store BIOS settings. It is traditionally called CMOS RAM because it uses a volatile, low-power complementary metal-oxide-semiconductor (CMOS) SRAM (such as the Motorola MC146818 or similar) powered by a small "CMOS" battery when system and standby power is off. It is referred to as non-volatile memory or NVRAM ...
