A shunt must stabilize at each temperature / current level. The thermal mass of a shunt includes its resistance element, its end blocks, the current cable lugs and connection hardware, and the cables themselves. At higher current levels, a shunt may require more than an hour to reach thermal equilibrium. This is when measurement should begin.

The Denver shunt has proven useful for treatment of abdominal and pleural cirrhotic ascites but, of course, has no place in the control of variceal bleeding. There is evidence in small trials that physiologic and quality of life improvements are enhanced by early placement of the shunt before the patient has deteriorated to the point that short-term survival is threatened [13 , 14].
